

March 21, 2012

Release of the Accumulated Dose Estimations for the Period from
March 11, 2011, to March 11, 2012, at Points where Measurements
Have been Carried out Continuously

Based on the Comprehensive Monitoring Plan (decided at the Monitoring Coordination Meeting on August 2, 2011), MEXT has prepared and released distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps) every month. However, due to snowfalls in Fukushima prefecture on and after January 17, 2012, it has become difficult to prepare accurate distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps). Therefore, MEXT releases only a list of accumulated dose estimations for the period from March 11, 2011, to March 11, 2012, at points where measurements have been carried out continuously.

Emergency Operation Center

Oku

Tel: 03-5253-4111 Ex.4604, 4605

1. Release of data for March 2012

- Due to snowfalls in Fukushima prefecture on and after January 17, 2012, unusual declines were observed in air dose rates in some areas including fixed measuring point No. 32, which is one of the reference points for calculating estimates in preparing distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps). This makes it difficult to prepare distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps) as of March 11, 2012, at the same accuracy level by way of the same estimation method as that used so far* for preparing maps.
- Considering these circumstances, MEXT does not prepare distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps) for the period from March 11, 2011, to March 11, 2012, as in the case of the previous data release on February 29, 2012, but only releases a list of accumulated dose estimations for the period from March 11, 2011, to March 11, 2012, at points where measurements have been carried out continuously, which has been attached to distribution maps of air dose rates, etc. (distribution maps of air dose rates and accumulated dose estimation maps) upon their release.

* For locations where the monitoring was started on or after March 19, the dose rate data for the period from March 17 to the day before the start of monitoring has been derived by assuming that the dose rate has changed in proportion to changes at Location No. 32, where the steepest dose rate change has been observed. In the case where no measurement results are available for the day on which measurement results are compiled, the mean value is calculated under the assumption that dose rates on the relevant day onward will remain proportional to dose rates at fixed measuring point No. 32. Accumulated doses are to be estimated by taking into consideration the reduction effect of wooden buildings (0.4) when staying outdoors for eight hours and indoors for 16 hours.

Accumulated dose estimation at respective points based on the measurement results from March 11, 2011 to March 11, 2012

This table was jointly compiled by the Nuclear Safety Commission, MEXT, and the Nuclear and Industrial Safety Agency.

*1: Information on the latitude and longitude of each monitoring spot is available on the MEXT website.

*2: Shown values are integrated values monitored from 6:00, March 12, 2011 through 24:00, March 11, 2012. The same estimation method as that used by the Nuclear Safety Commission on March 26, 2011 is used, whereby the values are estimated by multiplying the monitored values by 0.6 in consideration of the reduction effect of wooden buildings (0.4) when staying outdoors for eight hours and indoors for 16 hours.

Calculated under the assumption that the latest measured values are maintained up to 24:00, March 11, 2012

For locations where the monitoring was started on or after March 19, the dose rate data for the period from March 17 to the day before the start of monitoring has been derived by assuming that the dose rate has changed in proportion to changes at Location No. 32, where the steepest dose rate change has been observed.

For the period where actual values monitored by a simple integrating dosimeter are available, such values are indicated.

*3: At points marked with “ ”, snowfall was confirmed from 0:00, December 20, 2011 to 24:00, March 11, 2012.

*4: At Point 1 in other areas, measurement was carried out on the second floor (outdoors) of the Fukushima prefectural government building.

Changes in air dose rates

Notes: In cases where more than one reading was taken during the six-hour period, the maximum value is plotted.

Monitoring Date
